

ABSTRACT OF DISCLOSURE

A method to provide a convenient user interface to change a display setting of a picture area of a display apparatus, which is communicated with an external device, the method including: displaying a main window including a step start button to initiate a sequence of at least first and second display setting adjustment windows in which first and second display setting adjustments are made; displaying sequentially the display setting adjustment windows corresponding to a selection of the step start button; adjusting the display setting through the displayed display setting adjustment windows; issuing a command from the external device in correspondence to adjusting the displayed display setting adjustment windows; and setting the display setting in correspondence to the command. With this configuration, the present invention provides a convenient user interface to adjust a plurality of display settings of a picture area.
